

# Using OpenStack

---

**Andrew Mallett**

LINUX AUTHOR AND TRAINER

@theurbanpenguin [www.theurbanpenguin.com](http://www.theurbanpenguin.com)

# Objectives

**Create OpenStack RC File**

**Enable TAB Completion**

**Verify Services and Authentication**

**Using --debug**

**Help**

Project > Compute > Access and Security

## Create OpenStack RC Files

**We can use Horizon to download RC Files for our users. These prompt for the password rather than storing the password in the file.**

# OpenStack RC Files

---

```
# openstack
```

```
openstack> server TAB TAB
```

```
# openstack complete >> adminrc.sh
```

```
# openstack complete >> demorc.sh
```

## OpenStack Completion

**We have tab completion enabled within the interactive openstack command but not on the command line. We can add the completion functions to the run control files.**

# OpenStack TAB Completion

---

```
# openstack endpoint list --service compute
# nova service-list

# openstack endpoint list --service image
# openstack image list

# openstack endpoint list --service network
# neutron agent-list

# openstack endpoint list --service cinderv2
# cinder service-list
```

## Verify Services

**We have seen during the course how we have tested services. Let's remind ourselves**

```
# openstack token issue
```

```
# openstack user show <user_id>
```

## Test Authentication

**To test authentication we can use the token issue sub-command. To list the user name we can copy the long user id into the user show sub-command**

```
# openstack token issue --debug
```

## Debug

To expand upon any potential issue an openstack command can be run with the **--debug** option

# Verify Operation

---

```
# openstack help compute service list  
  
# openstack openstack compute service list \  
-c Binary -c Host -c Status -c State  
  
# openstack compute service list -f yaml
```

## Help

Add help before the sub-command. Many commands that output data allow for the columns to be selected to reduce the screen clutter. We can also choose the output format

# Help and Formatting

---

**Finalized the Lab Setup course by summarizing a little of what we have seen during these modules**

**OpenStack RC Files**

**TAB Completion**

**Verify Services and Authentication**

**Getting Help**
